

### DAY-3

Write a Python program that takes a student's marks in three subjects as input.

- If the average is greater than or equal to 90, print "Grade: A".
- If the average is between 80 and 89, print "Grade: B".
- If the average is between 70 and 79, print "Grade: C".
- Otherwise, print "Grade: Fail".

The screenshot shows a JupyterLab window with a Python notebook. The code in the notebook is as follows:

```
[11]: # day 3
a = float(input("Enter marks for Subject 1: "))
b = float(input("Enter marks for Subject 2: "))
c = float(input("Enter marks for Subject 3: "))

avg = (a + b + c) / 3

if avg >= 90:
    result = "A"
elif 80 <= avg < 90:
    result = "B"
elif 70 <= avg < 80:
    result = "C"
else:
    result = "Fail"

print(f"Grade: {result}")
```

The output of the code is displayed below the code cell:

```
Enter marks for Subject 1: 95
Enter marks for Subject 2: 83
Enter marks for Subject 3: 80
Grade: B
```

The JupyterLab interface includes a menu bar (File, Edit, View, Run, Kernel, Settings, Help) and a toolbar with various icons for file operations and execution. The browser address bar shows the local host URL: localhost:8888/notebooks/2311cs020156.ipynb.
